

New Production Facility

Wednesday, 06 August 2008

Argon Technology cut the ribbon on its new multi-divisional production facility in Belmont, Western Australia last week. The facility, a 750m² factory with 150m² office and 400m² yard is a stones throw from the corporate headquarters and engineering design base and will perfectly complement existing operations, to help take Argon into the next phase of the growth cycle.

Argon has undergone tremendous, dynamic growth in the last 18 months with this the second premises acquisition in that time. The move to expand into a larger workshop was necessary to meet current demand for the company's services. Corporate services and engineering design will still be based out of Argon's primary Belmont facility. "This will allow us the capability to really attack a number of diverse market opportunities that exist, as well as consolidate all areas in which we currently operate. There really is nothing to stop us moving forward with full scale production of robotic and automation systems from here. It's an exciting time for us," Paul A. Deuchar CEO of Argon Technology. Both facilities are located on Belmont Ave in Belmont, WA. Right in the heart of key transport arteries, and close to the CBD of Perth. This upgraded facility will help Argon do what it does best and serve its client base to the best of its ability, and allow Argon Technology to remain as Australia's premier provider of robotic and automation solutions.
